

Common interpreter interface

Left: `Number&` referring to `Int(6)`
Right: `Number&` referring to `Double(2.5)`

Select the left kind

Left acceptance reaches the `Int` visitor overload.
The next visitor carries a `const Int&`.

Select the right kind

Right acceptance reaches the `Double` overload.
The selected operation knows both `Int` and `Double`.

Arithmetic and result construction

`int` and `double` payloads yield a `double` result.
The factory creates `Double(15.0)`, returned as `Number*`.
